

REMARKS

Applicants respectfully request the Examiner to reconsider the merits of the objections and rejections in view of the foregoing amendment and following remarks.

Upon entry of the foregoing amendment, claims 39-41, 43, 49-51, 58-63, and 69-74 are pending in the application.

Claims 34-38, 42, 44-48, 52-57 and 64-68 are withdrawn.

Claims 1-33, 40, 59 and 70 are cancelled.

Applicants respectfully request entry of the above amendment and submit that the above amendment does not constitute new matter.

Priority

Applicants respectfully request the Examiner to reconsider their claim for domestic priority under 35 U.S.C. § 120 in view of the newly amended claims.

Rejection under 35 U.S.C. § 112 – Enablement

Claims 39-41, 43, 49-51, 58-63, and 69-74 stand rejected under 35 U.S.C. 112, first paragraph. The Examiner states the following:

The specification fails to provide an enabling disclosure for the use of any lower primate animal model for any human pathogen. The claims encompass the use of any lower primate species as a model for infection with any human pathogen. However, the specification only discloses *Tupaia belangeri* as an animal model for HBV and HIV infections. No guidance is offered with regard to how one skilled in the art would develop other lower primate animal models for human pathogens. No other human pathogens were examined for their capacity to infect any

lower primate animal species. No other lower primate animal species were examined for their susceptibility to any human pathogen. There are numerous human pathogens including bacterial, viral, protozoan, and parasitic pathogens. The claims cover the use of any lower primate animal species infected with any human pathogen. No guidance is offered with regard to the numerous parameters that must be examined to determine if one or more of the lower primate species of animals is susceptible to infection by a single human pathogen. Furthermore, genetic modification may be used to render a lower primate animal susceptible to infection by a human pathogen. The claims encompass genetically modified animals, but the specification does not disclose any genetic modifications that could be made to render a given animal susceptible to infection by a given human pathogen. The instant specification only deals with two viral pathogens and their infectivity in a single species of animal. Animal models of human infectious disease are notoriously unpredictable as evidenced by the numerous attempts to produce or identify a suitable animal model for HIV infection (see Lewis et al., 1995). Lewis et al. (1995) discuss the many problems that exist with regard to the disease characteristics displayed by the best animal models for HIV infection. None of the animal models exhibit the ideal characteristics as outlined in Box 1, page 144. Thus, despite an enormous amount of data on the HIV virus and its role in causing AIDS and despite intense efforts to generate an adequate animal model, significant deficiencies remain.

Given the lack of specific guidance in the specification with regard to generating or identifying lower primate animal models for human pathogens, the limited working examples disclosed, and the unpredictability in the art for developing

lower primate animal models of human infectious diseases, one skilled in the art would have been required to engage in undue experimentation to produce the claimed lower primate animal models and to use the animal models in the claimed methods.

Applicants believe that the Examiner's rejections have been addressed by the foregoing claim amendments. The claims have been amended to limit "any lower primate animal model" to *Tupaia*. Also, "any human pathogen" has been limited to "human viral pathogen".

Considering the Examiner's comments concerning the lack of guidance being offered with regard to parameters that would be examined to determine if a lower primate was susceptible to a human (viral) pathogen, the particular symptoms and effects would be well known for any particular human (viral) pathogen and it would be an obvious approach to investigate the well-known parameters associated with the disease caused by that virus.

II. **Rejections under 35 U.S.C. §112 – Written Description**

Claims 39-41, 43, 49-51, 58-63, and 69-74 stand rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The Examiner states the following:

The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

The claims are directed to the use of a lower primate animal model for a

human pathogen and methods for developing a therapeutic procedure.

The claims encompass the use of any lower primate animal species as a model for any human pathogen in the claimed methods. However, the specification only discloses two animal model systems. *Tupaia belangeri* were shown to be susceptible to infection by UBY and HIV-1. No other human pathogens were examined for their capacity to infect any animal species. No other animal species were examined for their susceptibility to any human pathogen. There are numerous human pathogens including bacterial, viral, protozoan, and parasitic pathogens. The claims cover the use of any lower primate animal species. Furthermore, genetic modification may be used to render a lower primate animal susceptible to infection by a human pathogen. The claims encompass genetically modified lower primate animals, but the specification does not disclose any genetic modifications that could be made to render a lower primate animal susceptible to infection by a human pathogen. The instant specification only deals with two viral pathogens and their infectivity in a single species of lower primate animal. Thus, the specification does not disclose a representative number of model systems that include a representative number of animal species in combination with a representative number of human pathogens. In analyzing whether a written description requirement is met for genus claims, it is first determined whether a representative number of species have been described by their complete structure. In this case, only two animal models are disclosed. Next, then, it is determined whether a representative number of species have been sufficiently described by other relevant identifying characteristics. In this case, no other relevant identifying characteristics

have been disclosed. The specification does not teach a generally applicable methodology that can be used to identify animal species that can be productively infected with a given human pathogen. This limited information regarding the claimed embodiments is not deemed sufficient to reasonably convey to one skilled in the art that Applicants were in possession of the full scope of lower primate animal models at the time the application was filed. Thus it is concluded that the written description requirement is not satisfied for the claimed genus.

With regard to the claimed methods for developing a therapeutic procedure, adequate written description is not provided. The specification does not disclose any product or process developed or derived from any animal model as set forth in the claims. Even as relates to the disclosed *Tupaia* animal models, no screening methods are disclosed as such. The absence of any written description of screening methods as claimed does not satisfy the written description requirement for the claimed genus. Thus it is concluded that the written description requirement is not satisfied for the claimed methods.

Applicants claim HCV and retroviruses as the particular human viral pathogens of interest. It was known in 1998 that HCV could infect *Tupaia* at least transiently (Xie et al. 1998 Virology 244; 513-520). The use of an animal model has two barriers. The first is the ability of a human virus to successfully infect a non-human. The second is the nature of the manifestation of the disease. The first barrier was already known to be overcome by the publication by Xie et al., whereas the second was a likely prediction based upon the disease manifestations exhibited by HBV infection as described in the specification. Although HBV and HCV are very different viruses and carry out very

different lifecycles, they possess commonalities in their targeting of liver cells, in the response to their infection via an induced autoimmune reaction, and in the presence of secondary disease manifestations in Tupaia (after HBV infection allowed a deduction that a similar phenomenon would likely be found when investigating HCV infection in Tupaia). Subsequent to the filing of the present application, two papers have been published describing this: 1) Zhao et al. 2000 (J. Clin. Invest. 109; 221-232), which discovered that HCV can produce infective viral particle in hepatocytes isolated from Tupaia; and 2) Xu et al. 2007 (J Gen Vir; 88; 2504-2512), which disclosed that chronic HCV infections could be detected after inoculation of Tupaia with HCV.

With regard to retroviruses, a number of these viruses are known to exhibit a wide spectrum of species that result in viruses grown in mouse cells being able to be used to infect human cells. One of the most notoriously species-specific variety of retrovirus, HIV, was shown in the specification as capable of infecting Tupaia thereby showing that a number of retroviruses should be infective towards this lower primate animal model.

In conclusion, Applicants believe that undue experimentation would not be necessary to investigate the parameters of human viral infections of Tupaia.

Regarding the Examiner's comments for developing therapeutic procedures, it was well known that animal models of human diseases served two major purposes. The first was for understanding the progression and nature of a disease caused by a pathogen. The second was that they served as surrogates for the development of therapeutic procedures. Reference to both of these useful features were described in the specification. The methods used for both of these uses are well known in the art, and a user would understand procedures that could and would be used after disclosure of the novel animal models of the present invention. It also should be noted that Example 2 is

a demonstration of oral tolerance in Tupaia to HBV, which resulted in an alleviation of a secondary manifestation (liver destruction by autoimmune responses), as shown by a drop in ALT levels and a decrease in fibrosis, as well as other signs of liver inflammation.

Claims 40, 41, 51, 58-63, and 71-73 stands rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. The Examiner states the following:

Claims 51 and 58-63 are indefinite in their recitation of “secondary disease manifestations” because the specification does not define a “secondary disease manifestation.” The specification states on page 2, lines 6-7 that “secondary manifestations can include inflammation, fibrosis, induced auto-immunity, apoptosis and cancer.” These are non-limiting examples of potential secondary manifestations, but do not serve to define what a secondary manifestation actually is. The specification also refers to “primary and secondary disease manifestations” (p. 7, lines 18-19), but does not distinguish one from the other. One skilled in the art would not know what constitutes a secondary disease manifestation. Thus, the metes and bounds of the claims are not clearly set forth.

At pages 22-23, Applicants cite several portions of page 2 of the specification. However, the cited sections do not further define the term, but only refer to non-limiting examples of potential secondary manifestations. The metes and bounds of the claims are not clearly set forth.

Claims 40, 59, and 70 are indefinite in their recitation of “wherein said lower primate comprises a member of the genus Tupaia” because an animal cannot comprise anything more than one animal. Use of the phrase “wherein the lower primate belongs to the genus Tupaia” is recommended.

Claim 60 is indefinite in its recitation of the phrase “wherein said human pathogen comprises a human retrovirus.” Claim 61 is indefinite in its recitation of “wherein said human retrovirus comprises HLV I, HIV 2, HTLV-1 or I-ITLV-2.” Claim 62 is indefinite in its recitation of “wherein said human pathogen comprises HBV or HCV.” Claim 71 is indefinite in its recitation of “wherein said human pathogen comprises a human retrovirus.” Claim 72 is indefinite in its recitation of “wherein said human retrovirus comprises HIV I, HIV 2, HTLV-1 or HTLV-2.” Claim 73 is indefinite in its recitation of “wherein said human pathogen comprises HBV or HCV.” As discussed in the preceding paragraph, the term “comprises” cannot be used in this context because HBV is a human pathogen and therefore cannot be only a part of a human pathogen as implied by the use of the term “comprises.”

With regard to the Examiner’s comments concerning secondary disease manifestations, this term has been defined in the specification. The Background of the Invention states: “There may be secondary manifestations of the infection that are not directly related to propagative effects of the pathogens themselves”. Therefore, lysis of a blood cell during viral propagation inside such a cell would be a direct manifestation of the disease process, while the subsequent lack of a number of CD4 cells after HIV infection would lead to a secondary effect, where other pathogens would be able to propagate in the immune comprised host. In short, secondary disease manifestations are disease effects that are not directly caused by viral propagation.

Applicants believe that the foregoing claim amendments have addressed the remaining rejections. Therefore, Applicants respectfully request that the Examiner withdraw these rejections, and place claims 40, 41, 51, 58-63 and 71-73 in condition for allowance.

Claims 69, 70, and 73 stand rejected under 35 U.S.C. 102 (b) as being anticipated by Yan et al. (1996). The Examiner states the following:

Yan et al. (1996) disclose that *Tupaia belangeri* can be experimentally infected with human hepatitis B virus (HBV). Infection can be prevented by immunization with hepatitis B vaccine.

The therapeutic procedure described in the claims of the present Application occurs after infection, whereas Yan et al. is concerned with preventing infection before it can even take place. The present invention first creates an infection in the animal model and subsequently treats it. These steps are absent in the Yan et al. reference.

Serial No. 10/042,711

Filed: December 12, 2001

Page 15 (Amendment and Response to August 8, 2007 Office Action– October 29, 2007)

CONCLUSION

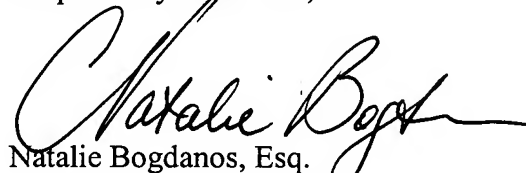

In view of the foregoing remarks, Applicants respectfully request reconsideration and withdrawal of the rejection of record of Claims 39-41, 43, 49-51, 58-63, and 69-74. Therefore, Claims 39-41, 43, 49-51, 58-63, and 69-74 are presented for further examination.

Early and favorable reconsideration of this action is respectfully requested.

No fee or fee(s) are believed to be due in connection with this response. In the event that any other fee or fees are due, however, authorization is further given to charge the amount of any such fee(s) to Deposit Account No. 05-1135, or to credit any overpayment thereto.

If a telephone conversation would further the prosecution of the present application, Applicants' undersigned attorney requests that she be contacted at the number provided below.

Respectfully submitted,

Natalie Bogdanos, Esq.

Art Unit: 1632

DETAILED ACTION

The amendment filed on May 2, 2007 has been entered. Claims 46-48 and 65 have been amended. The remarks filed August 10, 2005 (hereinafter referred to as "the response") are considered herein.

Applicants' election of Group III, Claims 39-41, 43, 49-51, 58-63, and 69-74 in the response filed June 21, 2006 is acknowledged. The elected invention is drawn to a method for developing a therapeutic procedure in a model animal system (*in vivo* testing of a procedure).

Claims 34-74 are pending in the instant application.

Claims 34-38, 42, 44-48, 52-57, and 64-68 are withdrawn from further consideration pursuant to 37 CFR 1.142(b) as being drawn to a nonelected invention, there being no allowable generic or linking claim. Election was made without traverse in the reply filed on June 21, 2006.

Claims 39-41, 43, 49-51, 58-63, and 69-74 are examined herein.

Priority

Applicant's claim for domestic priority under 35 U.S.C. § 120 is acknowledged. However, the non-provisional applications upon which priority is claimed fail to provide adequate support under 35 U.S.C. 112 for Claims 39-41, 43, 49-51, 58-63, and 69-74 of this application. The earlier-filed application does not disclose an animal model as recited in the instantly claimed methods.

Claim Rejections - 35 USC § 112

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Art Unit: 1632

Enablement

Claims 39-41, 43, 49-51, 58-63, and 69-74 are rejected under 35 U.S.C. 112, first paragraph, because the specification, while being enabling for the use of *Tupaia belangeri* infected with HIV or HBV in the claimed method for developing a therapeutic procedure, does not reasonably provide enablement for the use of any animal model of any species or for other human pathogens. The specification does not enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the invention commensurate in scope with these claims.

The claims are directed to a method for developing a therapeutic procedure, wherein the method involves the use of any lower primate animal model as recited in the claims.

The specification fails to provide an enabling disclosure for the use of any lower primate animal model for any human pathogen. The claims encompass the use of any lower primate species as a model for infection with any human pathogen. However, the specification only discloses *Tupaia belangeri* as an animal model for HBV and HIV infections. No guidance is offered with regard to how one skilled in the art would develop other lower primate animal models for human pathogens. No other human pathogens were examined for their capacity to infect any lower primate animal species. No other lower primate animal species were examined for their susceptibility to any human pathogen. There are numerous human pathogens including bacterial, viral, protozoan, and parasitic pathogens. The claims cover the use of any lower primate animal species infected with any human pathogen. No guidance is offered with regard to the numerous parameters that must be examined to determine if one or more of the lower primate species of animals is susceptible to infection by a single human pathogen. Furthermore, genetic modification may be used to render a lower primate animal susceptible to infection by a human pathogen. The claims encompass genetically modified animals, but the specification does not disclose any genetic modifications that could be made to render a given animal susceptible to infection by a given human pathogen. The instant specification only deals with two viral pathogens and their infectivity in a single

Art Unit: 1632

species of animal. Animal models of human infectious disease are notoriously unpredictable as evidenced by the numerous attempts to produce or identify a suitable animal model for HIV infection (see Lewis et al., 1995). Lewis et al. (1995) discuss the many problems that exist with regard to the disease characteristics displayed by the best animal models for HIV infection. None of the animal models exhibit the ideal characteristics as outlined in Box 1, page 144. Thus, despite an enormous amount of data on the HIV virus and its role in causing AIDS and despite intense efforts to generate an adequate animal model, significant deficiencies remain.

Given the lack of specific guidance in the specification with regard to generating or identifying lower primate animal models for human pathogens, the limited working examples disclosed, and the unpredictability in the art for developing lower primate animal models of human infectious diseases, one skilled in the art would have been required to engage in undue experimentation to produce the claimed lower primate animal models and to use the animal models in the claimed methods.

Applicants have not presented any arguments directed to this ground of rejection.

Written Description

Claims 39-41, 43, 49-51, 58-63, and 69-74 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

The claims are directed to the use of a lower primate animal model for a human pathogen and methods for developing a therapeutic procedure.

The claims encompass the use of any lower primate animal species as a model for any human pathogen in the claimed methods. However, the specification only discloses two animal model systems. *Tupaia belangeri* were shown to be susceptible to infection by HBV and HIV-1. No other human

Art Unit: 1632

pathogens were examined for their capacity to infect any animal species. No other animal species were examined for their susceptibility to any human pathogen. There are numerous human pathogens including bacterial, viral, protozoan, and parasitic pathogens. The claims cover the use of any lower primate animal species. Furthermore, genetic modification may be used to render a lower primate animal susceptible to infection by a human pathogen. The claims encompass genetically modified lower primate animals, but the specification does not disclose any genetic modifications that could be made to render a lower primate animal susceptible to infection by a human pathogen. The instant specification only deals with two viral pathogens and their infectivity in a single species of lower primate animal. Thus, the specification does not disclose a representative number of model systems that include a representative number of animal species in combination with a representative number of human pathogens. In analyzing whether a written description requirement is met for genus claims, it is first determined whether a representative number of species have been described by their complete structure. In this case, only two animal models are disclosed. Next, then, it is determined whether a representative number of species have been sufficiently described by other relevant identifying characteristics. In this case, no other relevant identifying characteristics have been disclosed. The specification does not teach a generally applicable methodology that can be used to identify animal species that can be productively infected with a given human pathogen. This limited information regarding the claimed embodiments is not deemed sufficient to reasonably convey to one skilled in the art that Applicants were in possession of the full scope of lower primate animal models at the time the application was filed. Thus it is concluded that the written description requirement is not satisfied for the claimed genus.

With regard to the claimed methods for developing a therapeutic procedure, adequate written description is not provided. The specification does not disclose any product or process developed or derived from any animal model as set forth in the claims. Even as relates to the disclosed *Tupaia* animal models, no screening methods are disclosed as such. The absence of any written description of screening

Art Unit: 1632

methods as claimed does not satisfy the written description requirement for the claimed genus. Thus it is concluded that the written description requirement is not satisfied for the claimed methods.

Applicants have not presented any arguments directed to this ground of rejection.

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 40, 41, 51, 58-63, and 71-73 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claims 51 and 58-63 are indefinite in their recitation of "secondary disease manifestations" because the specification does not define a "secondary disease manifestation." The specification states on page 2, lines 6-7 that "secondary manifestations can include inflammation, fibrosis, induced auto-immunity, apoptosis and cancer." These are non-limiting examples of potential secondary manifestations, but do not serve to define what a secondary manifestation actually is. The specification also refers to "primary and secondary disease manifestations" (p. 7, lines 18-19), but does not distinguish one from the other. One skilled in the art would not know what constitutes a secondary disease manifestation. Thus, the metes and bounds of the claims are not clearly set forth.

At pages 22-23, Applicants cite several portions of page 2 of the specification. However, the cited sections do not further define the term, but only refer to non-limiting examples of potential secondary manifestations. The metes and bounds of the claims are not clearly set forth.

Claims 40, 59, and 70 are indefinite in their recitation of "wherein said lower primate comprises a member of the genus Tupaia" because an animal cannot comprise anything more than one animal. Use of the phrase "wherein the lower primate belongs to the genus Tupaia" is recommended.

Art Unit: 1632

At page 24 of the response, Applicants review the meaning of the transitional term comprises, but this definition fails to explain how one animal can “comprise” another animal.

Claim 41 is indefinite in its recitation of “comprises” because it is unclear how a human retrovirus can “comprise” HIV-1, HIV-2, HTLV-1 or HTLV-2. Use of the term “comprises” necessarily implies that the retrovirus can be made up of more than one type of virus. It cannot. A retrovirus is a single, distinct entity that cannot be subdivided into parts. A “retrovirus” refers to a whole pathogen and therefore cannot “comprise” HIV plus something else. Substitution of “is” for “comprises” would be remedial.

At page 24 of the response, Applicants review the meaning of the transitional term comprises, but this definition fails to explain how one virus can “comprise” another virus.

Claim 60 is indefinite in its recitation of the phrase “wherein said human pathogen comprises a human retrovirus.” Claim 61 is indefinite in its recitation of “wherein said human retrovirus comprises HIV 1, HIV 2, HTLV-1 or HTLV-2.” Claim 62 is indefinite in its recitation of “wherein said human pathogen comprises HBV or HCV.” Claim 71 is indefinite in its recitation of “wherein said human pathogen comprises a human retrovirus.” Claim 72 is indefinite in its recitation of “wherein said human retrovirus comprises HIV 1, HIV 2, HTLV-1 or HTLV-2.” Claim 73 is indefinite in its recitation of “wherein said human pathogen comprises HBV or HCV.” As discussed in the preceding paragraph, the term “comprises” cannot be used in this context because HBV is a human pathogen and therefore cannot be only a part of a human pathogen as implied by the use of the term “comprises.”

At page 24 of the response, Applicants review the meaning of the transitional term comprises, but this definition fails to explain how one virus can “comprise” another virus.

Art Unit: 1632

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 69, 70, and 73 are rejected under 35 U.S.C. 102(b) as being anticipated by Yan et al. (1996).

Yan et al. (1996) disclose that *Tupaia belangeri* can be experimentally infected with human hepatitis B virus (HBV). Infection can be prevented by immunization with hepatitis B vaccine.

Thus, the claimed invention is disclosed in the prior art.

Conclusion

No claims are allowable.

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.

Art Unit: 1632

Patent applicants with problems or questions regarding electronic images that can be viewed in the Patent Application Information Retrieval system (PAIR) can now contact the USPTO's Patent Electronic Business Center (Patent EBC) for assistance. Representatives are available to answer your questions daily from 6 am to midnight (EST). The toll free number is (866) 217-9197. When calling please have your application serial or patent number, the type of document you are having an image problem with, the number of pages and the specific nature of the problem. The Patent Electronic Business Center will notify applicants of the resolution of the problem within 5-7 business days. Applicants can also check PAIR to confirm that the problem has been corrected. The USPTO's Patent Electronic Business Center is a complete service center supporting all patent business on the Internet. The USPTO's PAIR system provides Internet-based access to patent application status and history information. It also enables applicants to view the scanned images of their own application file folder(s) as well as general patent information available to the public.

For all other customer support, please call the USPTO Call Center (UCC) at 800-786-9199.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Anne-Marie Falk whose telephone number is (571) 272-0728. The examiner can normally be reached Monday through Friday from 9:00 AM to 5:30 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Peter Paras, can be reached on (571) 272-4517. The central official fax phone number for the organization where this application or proceeding is assigned is (571) 273-8300.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to (571) 272-0547.
